

Here are the most commonly used **GitHub + Git commands** for day-to-day development.

1. Configure Git (First Time Only)

```
git config --global user.name "Your Name"  
git config --global user.email "your_email@example.com"
```

2. Initialize a Git Repository

```
git init
```

3. Check Repository Status

```
git status
```

4. Add Files

```
git add .
```

Or add a specific file:

```
git add filename
```

5. Commit Changes

```
git commit -m "Initial commit"
```

6. Connect Local Project to GitHub

```
git remote add origin https://github.com/username/repository.git
```

7. Verify Remote Repository

```
git remote -v
```

8. Push Code to GitHub

First push:

```
git push -u origin main
```

If your branch is master:

```
git push -u origin master
```

9. Pull Latest Changes

```
git pull origin main
```

10. Clone a GitHub Repository

```
git clone https://github.com/username/repository.git
```

11. Create a New Branch

```
git checkout -b feature-login
```

Or:

```
git switch -c feature-login
```

12. View Branches

```
git branch
```

13. Switch Branch

```
git checkout main
```

Or:

```
git switch main
```

14. Push a New Branch to GitHub

```
git push -u origin feature-login
```

15. Fetch Latest Changes

```
git fetch
```

16. View Commit History

```
git log
```

17. Delete a Local Branch

```
git branch -d feature-login
```

18. Delete a Remote Branch

```
git push origin --delete feature-login
```
